01 Introduction & getting started

title: Introduction & getting started description: Download the app, set up your first accounts, and understand how Mis Gastos works. slug: 01-introduccion order: 1 icon: BookOpen

Introduction & getting started

Mis Gastos is a **100% offline** personal finance app for Android. No account required, no data uploaded to any server, and it works without an internet connection.

What you can do with it:

- Record income, expenses, and transfers between accounts
 - Manage multiple accounts in different currencies
 - View visual reports of your finances
 - Track debts and investments
 - Back up all your data at any time
-

Download and installation

Mis Gastos is distributed as a direct APK — it's not available in any app store.

1

Download the APK

Go to the [downloads page](#) and tap **Download APK**. The file will be saved to your downloads folder.

2

Enable installation from unknown sources

Android blocks external APK installation by default. Go to **Settings > Security** (or **Settings > Apps > Install unknown apps**) and enable the permission for your browser or file manager.

3

Install the APK

Open the downloaded file and follow Android's installation prompts. The process takes a few seconds.

4

Open the app

Find **Mis Gastos** in your app drawer and open it. On the first launch you'll land directly on the home screen — no registration or login required.

Installation permission

If Android shows "App blocked by Play Protect", tap **Install anyway**. The app contains no malicious code — the warning appears because it doesn't come from the Play Store.

The home screen

When you open the app, the first thing you see is the **home dashboard**. It has three zones:

1. **Total net worth** — combined balance of all your accounts converted to the base currency.
2. **This month's income and expenses** — current month totals, also in the base currency.
3. **Recent transactions** — the last 8 records with type, account, and amount.

From the bottom bar you can navigate to the five main sections:

| Section | What it does | |---|---| | Home | Summary dashboard and recent transactions | | Transactions | Full history with filters | | Accounts | Account management and balances | | Reports | Charts and analysis | | More | Debts, investments, currencies, backup, settings |

Recommended initial setup

Before recording your first transaction, it's worth doing three things:

1. Choose your base currency

The base currency is what the app uses to convert balances from different-currency accounts and display the total net worth. You can change it in **More > Settings**.

Which base currency to choose?

Pick the currency you think in — usually the one of your country of residence. Once configured, all conversions go to that currency.

2. Add your currencies

If you operate with more than one currency (e.g., pesos and dollars), go to **More > Currencies** and add each one with its exchange rate. See [Currencies & exchange rates](#) for details.

3. Create your first accounts

Every wallet, card, or bank account is an **Account** in the app. Go to **Accounts > +** to add the first one. You can give it a name, assign a color, an icon, and the currency it operates in. See [Account management](#) for the full process.

How data flows

Mis Gastos has no backend. Everything lives in your device's local storage (Hive database). The flow is:

Your phone → Hive (local) → screen

Nothing leaves the device except when you choose to export a backup. This means:

- If you uninstall the app without a backup, **all data is lost**.
- If you switch phones, **you need to export and import** the JSON file.
- Two phones don't sync automatically — use the backup to transfer data.

Back up before uninstalling

Always export a backup from **More > Backup** before uninstalling the app or resetting your phone. The process takes less than five seconds.

Next steps

With the app installed and the base currency configured, the natural next step is to add your accounts:

- [Account management →](#)
- [Log your first transaction →](#)

02 Account management

title: Account management description: Create cards, wallets, bank accounts, and cash. Customize color, icon, and currency. slug: 02-cuentas order: 2 icon: Wallet

Account management

Accounts are the foundation of Mis Gastos. Every payment method you use — debit card, digital wallet, bank account, cash — lives as a separate account with its own balance, color, and currency.

Account types

The app supports five types:

Type	When to use it	--- ---	Card	Debit, credit, or prepaid	Wallet
	Digital (Mercado Pago, PayPal, etc.)	Bank	Checking or savings account		
Cash	Physical money you carry	Other	Any method not listed above		

The type doesn't affect functionality — it's purely visual to identify the account at a glance.

Creating an account

1

Open the Accounts section

Tap **Accounts** in the bottom navigation bar.

2

Tap the + button

The FAB (floating action button) in the bottom right opens the new account form.

3

Fill in the fields

- **Name:** what you want to call the account (e.g., "Visa Santander").
- **Type:** choose from the five available types.
- **Currency:** the currency this account operates in.
- **Initial balance:** the balance the account has when you create it. Use 0 if you're starting fresh or will load history later.
- **Color:** any color from the palette; helps distinguish accounts at a glance.
- **Icon:** pick the icon that best represents the account.

4

Save

Tap **Save**. The account appears instantly in the accounts list and on the home dashboard.

Initial balance

If you already have previous transactions you won't be entering, use the current real balance as the initial balance. If you're going to load the full history, start at 0 and the balance will be calculated from your transactions.

How the balance is calculated

The balance shown for each account is dynamic. The app calculates it as:

$$\text{Current balance} = \text{Initial balance} + \Sigma(\text{income}) - \Sigma(\text{expenses}) \pm \Sigma(\text{transfers})$$

You never store the balance directly — it's always derived from your transactions. This means if you correct or delete a transaction, the balance updates instantly.

Editing an account

Tap any account in the list to open it. From the detail view you can:

- Change name, type, color, or icon.
- Modify the initial balance.
- View the transaction history filtered to that account.

You can't change the currency of an account with transactions

If an account already has recorded transactions, changing its currency would distort all historical amounts. If you need to make the change, create a new account and transfer the balance.

Deleting an account

Swipe the account to the left in the list to reveal the delete button. The app asks for confirmation.

Deleting removes all associated transactions

When you delete an account, all its transactions **are deleted too**. If you just want to hide the account, there's currently no "archive" option — consider renaming it "Inactive" as a workaround.

Accounts in multiple currencies

You can have accounts in different currencies. For example:

- Account "USD Cash" → USD currency
- Account "ARS Account" → ARS currency
- Account "Crypto ETH" → ETH currency

The **total net worth** on the home dashboard converts all balances to the base currency using the rates you've configured. See [Currencies & exchange rates](#).

Limits and considerations

- There's no limit on the number of accounts.
- One account can't have two different currencies — for that, create two separate accounts.
- The app doesn't block recording expenses that would take a balance negative — it just shows it visually below zero.

03 Transactions

title: Transactions description: Log income, expenses, and transfers. Cross-currency handling included. slug: 03-transacciones order: 3 icon: ArrowLeftRight

Transactions

A **transaction** is any movement of money. Mis Gastos handles three types:

| Type | What it does | |---|---| | **Expense** | Reduces the balance of an account. Requires a category. | | **Income** | Increases the balance of an account. Requires a category. | | **Transfer** | Moves money from one account to another. No category. |

Recording a transaction

1

Open the form

Tap the + icon in the bottom bar, or from the Transactions screen tap the FAB. You can also reach it from the home dashboard.

2

Choose the type

The three tabs at the top of the form switch between Expense, Income, and Transfer. The form adapts to the selected type.

3

Fill in the fields

- **Amount:** a positive number in the origin account's currency.
- **Account:** where the money comes from (or goes to).
- **Category:** required for expenses and income; doesn't apply to transfers.
- **Date:** defaults to today; you can change it to load historical entries.
- **Note:** optional free-text field for context.

4

Save

Tap **Save**. The account balance updates instantly.

Transaction types in detail

Expense

Records a money outflow. The amount is subtracted from the chosen account's balance.

Specific fields: origin account, expense-type category.

Example: You pay \$15 at a coffee shop with your debit card → create an expense of \$15 from account "Debit Visa" in category "Restaurants".

Income

Records a money inflow. The amount is added to the chosen account's balance.

Specific fields: destination account, income-type category.

Example: Salary of \$3,000 lands in your bank account → create an income of \$3,000 in account "Bank Account" in category "Salary".

Transfer between accounts

Moves money from one account to another **within the app**. No category — transfers don't appear in income/expense reports.

Specific fields: origin account, destination account.

Cross-currency transfers

When the origin and destination accounts have **different currencies**, an additional field appears: **Destination amount**.

How it works:

1. You enter the amount in the origin account's currency (e.g., 100 USD).
2. The app pre-fills the destination amount automatically using the configured rate (e.g., if 1 USD = 1,000 ARS, it suggests 100,000 ARS).
3. You can freely edit the destination amount if the actual exchange rate that day differs.

The rate is a suggestion, not a rule

The destination amount field is always editable. If the real exchange rate that day was different from what you have configured, just overwrite the value. The app doesn't force you to use the saved rate.

Technical note: in the data model, this value is stored in `destinationAmount`. When it's `null` (same-currency transfer or legacy data), the app uses `amount` as the effective value for the destination account.

History and filters

From **Transactions** (bottom bar) you see the full history, grouped by month with totals.

Available filters:

- **Date:** custom range or presets (today, this week, this month, etc.).
- **Account:** filter by one or multiple accounts.
- **Category:** filter by a specific category.
- **Type:** only expenses, only income, only transfers.

You can also **search by text** in the notes field.

Editing a transaction

Tap any entry in the history to open it in the edit form. All fields are editable.

Retroactive corrections

If you entered the wrong amount or date, just edit the transaction. The balance recalculates automatically with the corrected value.

Deleting a transaction

Swipe the transaction to the left in the history, or use the "Delete" option inside the edit form.

Deletion is permanent

There's no recycle bin. If you delete a transaction by mistake, the only way to recover it is from a previous backup.

Monthly grouping

The history shows transactions grouped by month. Each group includes:

- The month and year as a header.
 - Income and expense totals for that group.
 - The list of transactions ordered by date, newest first.
-

Known limitations

- A transaction can only belong to one origin account. There's no splitting across accounts.
- There are no automatic recurring transactions — every entry is manual.
- The note field is free text with no length limit, but doesn't support file attachments or images.

04 Custom categories

title: Custom categories **description:** Organize your movements with your own categories, colors, and icons.
slug: 04-categorias **order:** 4 **icon:** Tag

Custom categories

Categories let you classify your transactions for later analysis. They're fully customizable: you define the name, color, and icon of each one.

Expense vs income categories

Each category belongs to one type: **expense** or **income**. There's no "transfer" category — transfers between accounts aren't categorized.

This means:

- Expense-type categories only appear when recording an expense.
 - Income-type categories only appear when recording income.
 - In reports, you can filter by type and see the corresponding categories.
-

Creating a category

1

Open Categories

From the bottom bar, tap **More**, then **Categories**.

2

Tap the + button

The FAB opens the new category form.

3

Fill in the form

- **Name:** e.g., "Groceries", "Restaurants", "Salary".
- **Type:** expense or income.
- **Icon:** choose from the available icon palette (based on Material Icons).
- **Color:** any color from the system palette.

4

Save

The category is immediately available when recording transactions.

No default categories

The app doesn't come with pre-loaded categories — you start from scratch. This is intentional: everyone has different spending habits. Create the ones you'll actually use so that reports are meaningful.

Common category ideas

Expenses:

- Housing (rent, HOA, utilities)
- Groceries (supermarket, farmers market)
- Restaurants & cafés
- Transportation (gas, public transit, taxis)
- Health (pharmacy, doctor, insurance)
- Entertainment (streaming, movies, outings)
- Education
- Clothing
- Technology

Income:

- Salary
 - Freelance / consulting
 - Rental income
 - Dividends / returns
 - Item sales
-

Editing a category

Tap any category in the list. The edit form lets you change name, type, color, and icon.

Changing the type may hide categories in the form

If you change a category from "expense" to "income", all expense transactions that used it still exist with that category — but you won't see it available when creating new expenses. This is an edge case; if you need to reorganize, it's better to create new categories.

Deleting a category

Swipe the category to the left to delete it.

Transactions are not deleted

When you delete a category, the transactions that had it assigned **are not deleted** — they just lose their category. You'll still see them in the history but they won't appear in the category breakdown in reports.

How categories are used in reports

Categories are the foundation of financial analysis in reports:

- **Pie chart:** distribution of expenses (or income) by category in the selected period.
- **Ranking:** top 5 most-spent categories.
- **Filter:** you can view the history of a single category from the Transactions screen.

The more consistently you categorize your transactions, the more useful reports become. A transaction without a category doesn't appear in charts.

Limits

- No limit on the number of categories.
- No subcategories — the hierarchy is flat.

- Names don't need to be unique per type — you can have "Miscellaneous" in expenses and "Miscellaneous" in income; they're separate entities.

05 Currencies & exchange rates

title: Currencies & exchange rates description: Set up multiple currencies and define conversion rates for your total net worth. slug: 05-monedas order: 5 icon: Globe

Currencies & exchange rates

Mis Gastos supports multiple simultaneous currencies. Each account has its own currency, and the app converts automatically when calculating the **total net worth** on the home dashboard.

The base currency

The **base currency** is the reference currency for all conversions. It's what you see in:

- The total net worth on the home dashboard.
- This month's income and expenses (home dashboard).
- Reports when you mix accounts in different currencies.

You can change it in **More > Settings > Base currency**.

Changing the base currency affects all calculations

If you change the base currency after loading data, all totals and charts recalculate with the current rates. Individual amounts don't change, but aggregates do.

Adding a currency

1

Open Currencies

From the bottom bar, tap **More > Currencies**.

2

Tap New currency

The FAB opens the form.

3

Fill in the fields

- **Code:** short identifier, e.g. `USD` , `EUR` , `BTC` . Can be any text — the app doesn't validate against an official list.
- **Symbol:** character shown before the amount, e.g. `$` , `€` , `฿` .
- **Name:** descriptive name, e.g. "US Dollar".
- **Rate:** how many units of *this currency* equal **1 unit of the base currency**.

4

Save

The currency is available to assign to accounts.

How the rate works

The rate expresses the relationship `X units of this currency = 1 base currency unit` .

The screen shows it clearly: "*1 BASE = X THIS*". The internal formula is:

```
value_in_base = value_in_currency × (1 / rateToBase)
```

where `rateToBase` is "how many units of this currency equal 1 unit of the base".

Concrete example:

- Base currency: USD
- Currency: ARS with `rateToBase = 1200` → 1200 ARS = 1 USD
- You have an account with ARS 120,000
- Net worth in USD = 120,000 / 1200 = **USD 100**

Update rates regularly

Rates don't update themselves — they're manual. If the exchange rate changes significantly, go to **More > Currencies**, tap the currency, and update the rate. Home dashboard balances will reflect the new value immediately.

The base currency in the list

In the Currencies screen, the base currency is marked with the "**Base**" chip. It can't be deleted or swiped to remove. You can edit its name and symbol.

Deleting a currency

Swipe the currency to the left.

You can't delete a currency that's in use

If there are accounts assigned to that currency, deletion fails. You must first delete or reassign the accounts that use it.

Currencies in cross-currency transfers

When making a transfer between two accounts with different currencies, the app:

1. Uses the configured rate to suggest the destination amount.
2. Lets you edit it freely if the current rate differs.

The actual amount credited to the destination account is what you type in the **Destination amount** field — not an automatic derivation. This gives you full control over the exchange rate applied to each operation. See [Cross-currency transfers](#).

Use cases

- **Simple multi-currency:** you have an ARS account and a USD account. Configure both currencies and see total net worth in ARS.
- **Cryptocurrencies:** add BTC with code `BTC`, symbol `₿`, and the current rate. Update the rate whenever you want to see the real value.
- **Fictional currencies:** you can create "points" or "credits" as a currency with a 1:1 rate to the base if you want to track balances in non-monetary units.

06 Reports

title: Reports **description:** Five analysis views of your finances — categories, monthly, net worth, ranking, and by person. **slug:** 06-informes **order:** 6 **icon:** BarChart3

Reports

Reports turn your transactions into charts. There are five tabs, each offering a different angle on your finances.

To access: tap **Reports** in the bottom navigation bar.

Global filters

Before diving into the tabs, **filters** at the top apply to all views:

- **Period:** quick presets (this month, this year, last 30 days, etc.) or a custom date range.
- **Accounts:** limit analysis to one or more specific accounts.
- **Categories:** filter by specific categories.
- **Type:** only expenses, only income, or both.

Income and expense totals for the selected period are shown below the filter panel as a quick reference.

Collapse filters for more space

Tap the filter panel header to collapse it and give the chart more room. State is remembered while you're on the screen.

Tab 1 — Categories (pie)

Shows a **pie chart** with the distribution of expenses (or income, based on the type filter) by category.

What you can see:

- Each slice is a category, with its percentage and amount in the base currency.
- Tapping a slice highlights it and shows that category's detail.
- If there are many small categories, the smallest ones are grouped into "Others".

When to use it: to understand which categories consume most of your money in a given period.

Tab 2 — Monthly (bars)

Shows **grouped bars** comparing income and expenses month by month over the last 6 months.

What you can see:

- Income bar (green) vs expense bar (red) per month.
- The month with the highest spending is visually prominent.
- Values are in the base currency.

When to use it: to spot trends — whether spending is rising, if a month was unusual, whether income consistently exceeds expenses.

Fixed 6-month window

This view always shows the last 6 calendar months, regardless of the period filter. It's the only tab that doesn't obey the date filter.

Tab 3 — Net worth (line)

Shows the **evolution of your net worth** over time — that is, the total balance of all your accounts (in base currency) day by day.

What you can see:

- A timeline from the start of the filtered period to today.
- Each point on the line is the total net worth at the close of that day.
- If the line goes up, you're saving; if it goes down, you're spending more than you earn.

When to use it: to see the real impact of your financial habits over time. A month where you "didn't spend much" but the line dropped might indicate investments or

unrecorded transfers.

Tab 4 — Ranking

Shows the **top 5 categories** with the highest expense (or income) in the period, in a horizontal bar chart.

What you can see:

- The 5 most significant categories, sorted highest to lowest.
- Absolute amount and a proportional bar to compare between them.

When to use it: to quickly identify your biggest sources of spending or income without navigating the full pie.

Tab 5 — By person

Shows expense (or income) **grouped by the transaction note**, useful for tracking finances with specific people.

How person grouping works

This tab groups transactions by the content of the "note" field. If every time you pay something for John you write "John" in the note, the By Person tab will show a subtotal for "John". There's no explicit "person" field — it's based on the note.

When to use it: if you use the app to track shared expenses or to keep track of who paid you what.

Tips to get more out of reports

1. **Always categorize:** a transaction without a category doesn't appear in the pie or the ranking. If you have many uncategorized transactions, reports will be incomplete.
2. **Use the account filter:** if you want to analyze only what you spend on your credit card, filter by that account.
3. **Month-to-month comparison:** the monthly chart is the fastest way to see whether your financial situation improved or worsened.
4. **Net worth as a compass:** check the Net Worth tab once a week. If the line consistently goes down, it's time to review spending.

07 Debts & loans

title: Debts & loans description: Record what you owe and what's owed to you. Partial payments and full tracking. slug: 07-deudas order: 7 icon: UserMinus

Debts & loans

The **Debts** section lets you track money you lent or borrowed, with partial payment tracking and an editable history.

To access: **More > Debts**.

Debt types

Mis Gastos distinguishes two directions:

| Type | Meaning | |---|---| | **They owe me** ([theyOweMe](#)) | You lent money; someone owes it to you. | | **I owe** ([iOwe](#)) | Someone lent you money; you owe it to them. |

Screen tabs

The screen has four tabs:

1. **By person**: groups all active debts by counterparty (person or entity name).
 2. **They owe me**: list of active "They owe me" debts.
 3. **I owe**: list of active "I owe" debts.
 4. **Paid**: fully settled debts.
-

Creating a debt

1

Tap the + button

The FAB on the Debts screen opens the form.

2

Fill in the form

- **Counterparty:** name of the person or entity (e.g., "John", "Bank of America").
- **Type:** whether you owe or are owed.
- **Currency:** the currency the debt is denominated in.
- **Original amount:** the total amount of the debt.
- **Due date** (optional): if the debt has a deadline.
- **Note** (optional): additional context.

3

Save

The debt appears in the corresponding list with the outstanding amount equal to the original amount.

Recording a partial payment

1

Open the debt

Tap the debt in the list to see its detail.

2

Tap Record payment

The payment button opens the partial payment form.

3

Fill in the payment

- **Amount:** how much was paid in this installment. Can be any value up to the outstanding amount.
- **Date:** the payment date.
- **Account** (optional): if you want to link the payment to an app account so it also records the transaction.
- **Note** (optional).

4

Save

The outstanding amount on the debt decreases by the payment amount. If the total paid reaches the original amount, the debt automatically moves to **Paid**.

Payments linked to an account

If you select an account when recording the payment, the app automatically creates a transaction in that account (income or expense depending on the debt direction). This is the cleanest way to keep the account balance in sync with the payment.

Summary panel

At the top of the Debts screen there's a summary strip showing:

- **Total owed to you:** sum of all active "They owe me" debts, in base currency.
- **Total you owe:** sum of all active "I owe" debts, in base currency.

Debts in currencies other than the base are converted using the configured rates.

Overdue debts

If you configured a due date and the debt is still active after that date, it appears marked as **overdue** in the list.

It's just a visual indicator

The "overdue" mark is informational — the app doesn't automatically block or charge anything. It's a visual reminder that the deadline has passed.

Editing or deleting a debt

Tap the debt to see editing options. You can change all fields from the original form.

Deleting a debt also deletes its payment history. Payments that generated account transactions **are not deleted** — they remain as independent records.

Payment history

The detail view of each debt shows the complete list of recorded payments: date, amount, and note. You can edit or delete each payment individually.

Editing a payment recalculates the outstanding amount

If you modify the amount of a payment, the debt's outstanding amount recalculates automatically. Same if you delete a payment.

Complete example

Scenario: you lent \$500 to Maria on January 1st. She made two partial payments.

1. Create a "They owe me" debt, counterparty "Maria", original amount \$500.
2. On January 15th, Maria pays \$200 → record a payment of \$200. Outstanding: \$300.
3. On February 1st, Maria pays the rest → record a payment of \$300. Outstanding: \$0. The debt moves to "Paid".

In the "By person" tab you'll see both debts grouped under "Maria" while they're active.

08 Investments & portfolio

title: Investments & portfolio description: Track stocks, crypto, bonds, and more. Automatic ROI and portfolio evolution. slug: 08-inversiones order: 8 icon: TrendingUp

Investments & portfolio

The **Investments** section lets you track financial assets outside of regular accounts: stocks, cryptocurrencies, bonds, fixed deposits, ETFs, funds, and more.

To access: **More > Investments**.

Supported investment types

| Type | Examples | |---|---| | **Stocks** | Apple, Google, local equities | | **Cryptocurrencies** | Bitcoin, Ethereum, USDT | | **Bonds** | Government bonds, corporate bonds | | **ETF** | SPY, QQQ, sector ETFs | | **Fund** | Mutual funds, hedge funds | | **Real estate** | Properties, land | | **Fixed deposit** | Savings deposits, time deposits | | **Other** | Any unlisted asset |

Creating an investment

1

Open Investments

From **More > Investments**, tap the FAB.

2

Fill in the base data

- **Name:** identifier for the investment (e.g., "BTC", "AAPL", "NYC Apartment").
- **Type:** one of the eight available types.
- **Currency:** the currency it's denominated in.

- **Current value:** the current market value. This field is updated manually whenever you want to reflect a price change.
- **Color and icon:** for visual identification.
- **Note** (optional).

3

Save

The investment appears in the portfolio list.

Investment movements

Each investment can have four types of movements:

| Type | What it does | |---|---| | **Deposit** | You bought or deposited money into this investment. | | **Withdrawal** | You sold or withdrew money from this investment. | | **Dividend / Return** | You received a dividend or interest payment. | | **Update value** | You update the current market value with no money movement. |

To record a movement, open the investment and tap **+ Movement**.

Deposits and withdrawals can link to an account

When recording a deposit or withdrawal, you can select an app account. If you do, a transaction is automatically created in that account (expense for a deposit, income for a withdrawal) so the account balance also stays updated.

ROI calculation

Return on investment (ROI) is calculated automatically from movements:

$$\begin{aligned}\text{Gain} &= \text{Current value} + \text{Total withdrawn} + \text{Total dividends} - \text{Total deposited} \\ \text{ROI\%} &= (\text{Gain} / \text{Total deposited}) \times 100\end{aligned}$$

Example:

- You deposited \$1,000 into AAPL stock.
- You received \$20 in dividends.
- Current value of the shares is \$1,150.
- $\text{ROI} = (1,150 + 20 - 1,000) / 1,000 \times 100 = \mathbf{17\%}$

ROI is based on total deposited, not net invested

If you deposited \$1,000 and later withdrew \$200, the base is still \$1,000 (total deposited), not \$800 (net invested). This may differ from other ROI calculators.

Updating the market value

Investments don't update themselves — the app has no connection to price services. To update the value:

1. Open the investment.
2. Tap **+ Movement**.
3. Choose type **Update value**.
4. Enter the new total market value.

This movement doesn't create any account transaction — it just updates the "current value" field of the investment.

Portfolio view

The main Investments screen shows:

- List of all investments with current value and ROI.
- Portfolio total in base currency (summing all investments converted).

The portfolio total is also shown on the home dashboard as part of net worth if you have investments loaded.

Deleting an investment

Tap the investment and find the delete option.

Deleting removes all investment movements

If the investment had movements linked to accounts, the account transactions **are not deleted** — they remain as independent records. Only the investment and its internal history are deleted.

Limitations

- No real-time prices — everything is manual.
- Current value is a single number (no automatic price history). The "Update value" movement history serves as a manual price record.
- No support for multiple positions (lots at different prices) — each investment is a single position.

09 Backup & restore

title: Backup & restore description: Export and import your database as JSON. Your data always safe. slug: 09-backup order: 9 icon: Archive

Backup & restore

Mis Gastos stores all data in the phone's local storage. **There is no automatic sync with any server.** Manual backup is the only way to protect your information against device loss, reinstallation, or switching phones.

To access: **More > Backup.**

What the backup includes

The backup file is a **JSON** containing:

- All your **accounts** (name, type, currency, color, icon, initial balance).
 - All your **transactions** (type, amount, date, note, category, account).
 - All your **categories** (name, type, color, icon).
 - All your **currencies** (code, symbol, name, rate).
 - All your **debts** and their payments.
 - All your **investments** and their movements.
 - Your **settings** (base currency, preferences).
-

Exporting a backup

1

Open Backup

From **More > Backup**, find the **Export** section.

2

Tap Export and share

The app generates the JSON file and opens Android's system **share sheet**.

3

Save to a safe location

Use the share sheet to:

- Save to Google Drive, Dropbox, or any cloud storage.
- Email it or send via WhatsApp to yourself.
- Save to another folder on your phone.

Back up regularly

A good practice is to export once a week. The file weighs just a few kilobytes even with thousands of transactions — storage isn't an issue.

Import and replace

This option **deletes all current data** and replaces it with the backup file's data.

1

Tap Import and replace

In the **Import** section of the Backup screen.

2

Confirm the warning

The app warns you that current data will be deleted. Only confirm if you're sure.

3

Select the JSON file

Android's file picker opens. Navigate to the backup you saved.

4

Wait for completion

Import is instant for most backups. When done, the app shows a confirmation message.

This deletes EVERYTHING

Import and replace permanently deletes all device data before loading the backup's data. There's no way to undo this operation.

Import and merge

This option **keeps existing data** and adds the backup's data. If there are ID conflicts (same records), the backup takes precedence (overwrites).

When to use it:

- You have data on two phones and want to combine them.
- You're restoring from an older backup but want to keep newer data you entered since then.

Watch out for duplicates

The merge can create duplicates if the same transaction exists in both datasets with different IDs. Review the history after merging.

Migrating to a new phone

The standard process for switching devices:

1. On the old phone: **More > Backup > Export and share** → save to the cloud.
 2. On the new phone: install Mis Gastos (APK).
 3. On the new phone: **More > Backup > Import and replace** → select the file from the cloud.
-

JSON file format

The backup is a flat JSON with the following keys in the root object:

```
{
  "accounts": [...],
  "transactions": [...],
  "categories": [...],
  "currencies": [...],
  "debts": [...],
  "debtPayments": [...],
  "investments": [...],
  "invMovements": [...],
  "settings": { "baseCurrencyCode": "USD" }
}
```

The format is human-readable — you can open it in any text editor to audit your data.

Backup FAQ

Can I manually edit the JSON and reimport it? Yes, as long as you respect the structure. If you modify a field to an invalid value, the import may fail.

What happens if I import a backup from an older app version? The app handles backward compatibility for fields added in newer versions: missing fields take default values.

Does the backup include the investment price history? Yes — "Update value" movements are exported as `invMovements` and the history is reconstructed on import.

10 OTA updates

title: OTA updates **description:** Update the app directly from itself, no Play Store required. **slug:** 10-actualizaciones **order:** 10 **icon:** RefreshCw

OTA updates

Mis Gastos includes an **Over-The-Air (OTA)** update system: you can check for a new version and download it without leaving the app and without going through any store.

To access: **More > Updates**.

How it works

The OTA system uses an endpoint URL pointing to an `update.json` file published on a server. The app queries that endpoint, compares the available version with the installed one, and if there's a newer version, offers to download it.

The `update.json` file has this structure:

```
{
  "version": "1.2.0",
  "build": 12,
  "apkUrl": "https://example.com/mis-gastos-1.2.0.apk",
  "releaseNotes": "Bug fixes and performance improvements.",
  "size": 8.4
}
```

Checking for updates

1

Configure the endpoint (first time)

If it's your first time using this feature, you need to enter the endpoint URL. In the Updates screen, find the text field for the URL. Enter the URL corresponding to your app's distribution source (usually the same source you downloaded the APK from).

2

Tap Check for updates

The app makes an HTTP request to the endpoint and retrieves the `update.json`.

3

Review the result

- If the remote version is **newer** than the installed one, new version info appears with release notes and file size.
 - If you're on the **latest version**, the app confirms it.
 - If there's an **error** (endpoint unavailable, no connection), the error message is shown.
-

Downloading and installing the update

1

Tap Download

The app downloads the APK in the background. A progress bar shows the progress with bytes received vs total.

2

Wait for completion

Download time depends on your connection and the APK size.

3

Install

Once downloaded, the **Install** button appears. Tapping it opens Android's native installer with the downloaded APK.

4

Confirm installation

Android's installer shows the APK details and asks for confirmation. Tap **Update** (or **Install**).

Data is not lost when updating

Updates installed over the same app preserve all your data. The Hive storage system persists across versions. Still, **back up before updating** as a good practice.

Installed version

At the top of the Updates screen you always see:

- **Installed version:** semantic version number (e.g., `1.1.0`).
 - **Build:** internal build number.
-

Custom endpoint

The endpoint URL is saved locally and persists between sessions. You can change it at any time from the text field. If you distribute the app within your organization or team, you configure your own `update.json` on your server and everyone updates from there.

Official distribution endpoint

If you downloaded Mis Gastos from the official page, the endpoint URL is the same one shown on the downloads page. Available at [Downloads](#).

FAQ

What happens if I close the app while downloading? The download is cancelled. You have to restart it.

Does the app check for updates automatically on launch? No. Checking is always manual — the app never makes network requests without you initiating it.

Can I use any URL as the endpoint? Yes, as long as it responds with a valid JSON in the expected format. You can host `update.json` on GitHub Pages, an S3 bucket, a VPS, or any static hosting.

Does the download verify APK integrity? There's currently no checksum verification. If you need to validate file integrity, do it manually by comparing the SHA256 hash of the downloaded APK with the one published on the distribution page.

11 FAQ

Frequently asked questions

Installation and compatibility

What Android versions does Mis Gastos support?

The app requires Android 6.0 (Marshmallow) or higher. It's tested on Android 10, 11, 12, 13, and 14.

Is Mis Gastos available on iOS?

No. Mis Gastos is exclusively for Android. There's no iPhone or iPad version.

Why does Android block the installation?

Android blocks APKs that don't come from the Play Store by default. Enable "Install from unknown sources" for your browser or file manager in Settings > Security (or Settings > Apps > Install unknown apps, depending on the manufacturer).

Does the app ask for special permissions?

Only the permissions needed for it to function: storage access (for backup) and internet (for OTA updates, only when you initiate it). It doesn't ask for contacts, camera, location, or notification permissions.

Data and privacy

Is my data uploaded to any server?

No. Mis Gastos has no backend or user account. All data lives in your phone's local storage. The app makes no network requests except when you manually check for updates.

What happens to my data if I uninstall the app?

It's deleted along with the app. Android removes application data on uninstall.

Back up before uninstalling.

Can I view the backup file the app generates?

Yes. The backup is a plain-text JSON file. You can open it in any text editor to view (or edit) your data.

Do backups sync automatically to the cloud?

No. The backup export opens Android's share sheet, where you choose where to save it (Google Drive, Dropbox, email, etc.). There's no automatic sync.

Accounts and transactions

Can I change the currency of an account?

Not directly if it already has transactions — changing it would distort all historical amounts. The recommended solution is to create a new account in the correct currency and transfer the balance.

Are there automatic recurring transactions?

No. All transactions are logged manually. There's no option to automatically repeat a monthly expense.

Can I import transactions from a CSV or Excel file?

Not currently. The only supported import format is the JSON backup generated by the app itself.

Is there a transaction limit?

No limit enforced by the app. The only practical limit is device storage, but a JSON file with 50,000 transactions weighs less than 50 MB.

Can I attach photos or receipts to a transaction?

No. The "note" field is free text but doesn't support file attachments or images.

Reports and categories

Why don't some transactions appear in the charts?

The transactions probably don't have a category assigned, or the active period/account filter excludes them. Check that the period filter covers the transaction dates.

Can I have subcategories?

No. The category hierarchy is flat — no subcategories or groupings. If you need more detail, use descriptive names (e.g., "Health - Pharmacy", "Health - Doctor").

Do reports update in real time?

Yes. Charts recalculate every time you open the Reports screen or change a filter.

Debts and investments

Can I track debts in different currencies?

Yes. Each debt has its own currency. The summary totals on the debts panel convert everything to the base currency.

Does the app connect to stock exchanges to update share prices?

No. Investment prices are always manual. You update the current value whenever you want.

Can I record a stock position with multiple lots at different prices?

Not directly. An investment is a single position. You can record each purchase as a "Deposit" movement, which accumulates the total cost, but you can't see the average price per lot.

Updates

How do I know there's a new version?

You check manually from **More > Updates**. The app doesn't send automatic update notifications.

Can I update without losing my data?

Yes. An update installed over the same app preserves all data. Still, it's always a good practice to back up first.

Common issues

The app crashes unexpectedly on launch

Try uninstalling and reinstalling the APK. If you have a backup, import it afterwards. If the problem persists with a specific APK version, verify that your Android version is compatible.

The backup doesn't import correctly

Make sure the file is the JSON generated by the app (not a manually edited file with syntax errors). The JSON must have the root object with the standard keys:

`accounts` , `transactions` , etc.

An account balance doesn't match what I expect

The balance is `initial balance +  $\Sigma$  income -  $\Sigma$  expenses  $\pm$  transfers` . Check the account's transaction history by filtering by that account in Transactions to identify unexpected entries.

Your question isn't here?

Use the contact section on the site to send us your question. We'll get back to you promptly.
